

SHORT FORM EDITOR

TRAINING

GOH CONSULTING

Goal: Help you achieve our exact editing style by following our step-by-step workflow when editing Short Form videos.

What this is

Below are some examples of our Short Form Editing Style. It consists primarily of A Roll, B Roll and UI Animations.

Examples:

- https://www.instagram.com/reel/DaLqduuBFF8/?utm_source=ig_web_copy_link&igsh=MzRIODBiNWFIZA==
- https://www.instagram.com/reel/DaBdUDcMXxV/?utm_source=ig_web_copy_link&igsh=MzRIODBiNWFIZA==
- https://www.instagram.com/reel/DZIEUIhMou5/?utm_source=ig_web_copy_link&igsh=MzRIODBiNWFIZA==

In this SOP, we will break down exactly how to replicate this style, the workflow to achieve this and resources required.

Step 1 - Clipping

This is the first and most important step of the editing process as it will directly affect the performance of the video once posted. There are two main parts to the clipping process:

1. Maximising Viral Potential
2. Removing Fluff & Errors

1. Maximising Viral Potential

When clipping Long Form Videos and converting them into Short Form Videos, we want to make sure we are intentional with what we choose to include in the video and what we choose to remove.

The video should not just be edited chronologically, it should be structured in a way that maximises retention and keeps the viewer hooked.

We've implemented AI into our Clipping Process allowing us to clip videos at scale.

You can access the exact SOP we use here: [Clipping SOP](#)

2. Removing Fluff & Errors

We also should be looking to remove fluff from the video. This is any segment that doesn't add any lasting message or value to the video or where the creator repeats something they have already said.

To streamline the video, also remove any errors where the creator is stuttering, pronounces words wrong or if there is a long pause.

Video Tutorial -

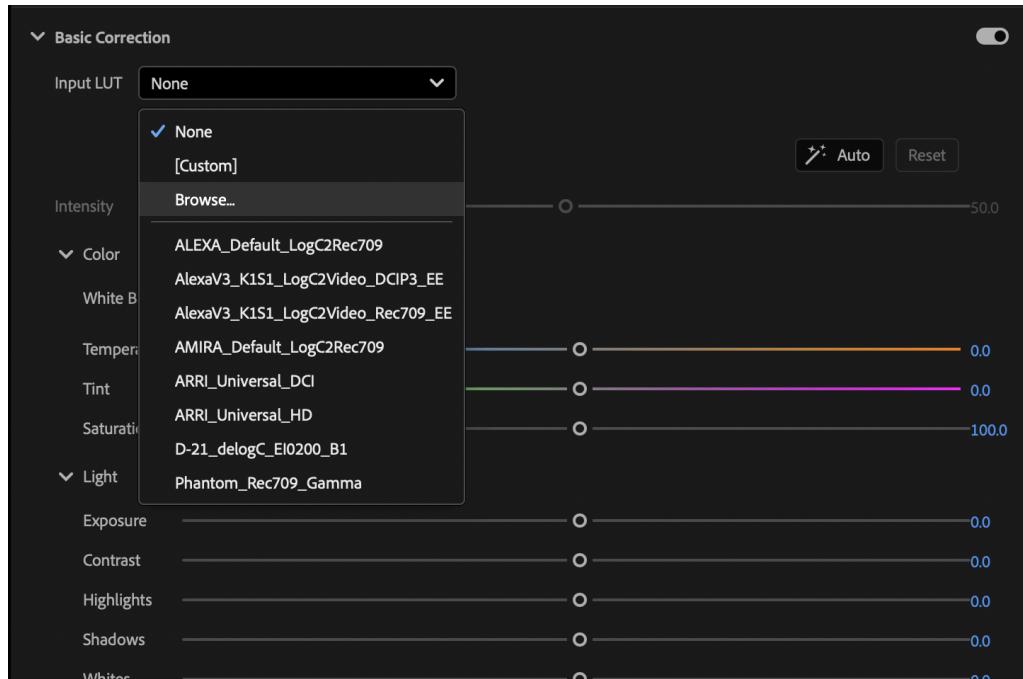

Step 2 - Colour Grade

If the footage was filmed in LOG, chances are it will look something like Version A in the image below.

To achieve the look of Version B, we've created a custom SooWei LUT that will save you hours of colour grading and allow you to replicate our aesthetic:

[Download Link to Custom SooWei LUT](#)

Once you've downloaded the LUT, select your footage in your timeline and head over to the Lumetri Colour Panel. Under Basic Correction, click Input LUT and browse.

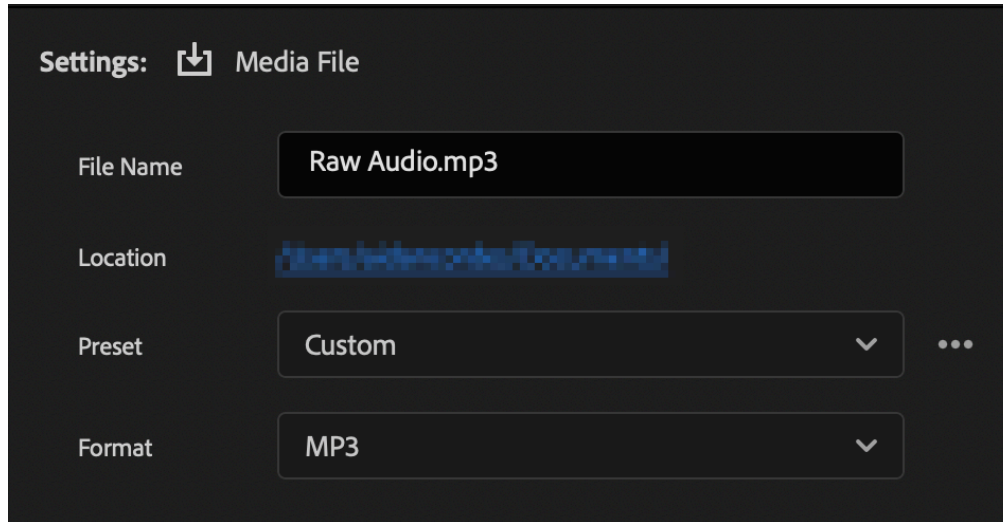

Then select the LUT from your Downloads and it will be applied to the footage.

Step 3 - Audio Enhancement

If the quality of the audio isn't optimal, there are a couple tools we can use to make it sound sharper. This should be used if: the audio is muffled, the video was filmed in windy conditions or if there is background noise.

First, export the raw audio as an MP3 File in Premier Pro. Your export settings should look something like this:

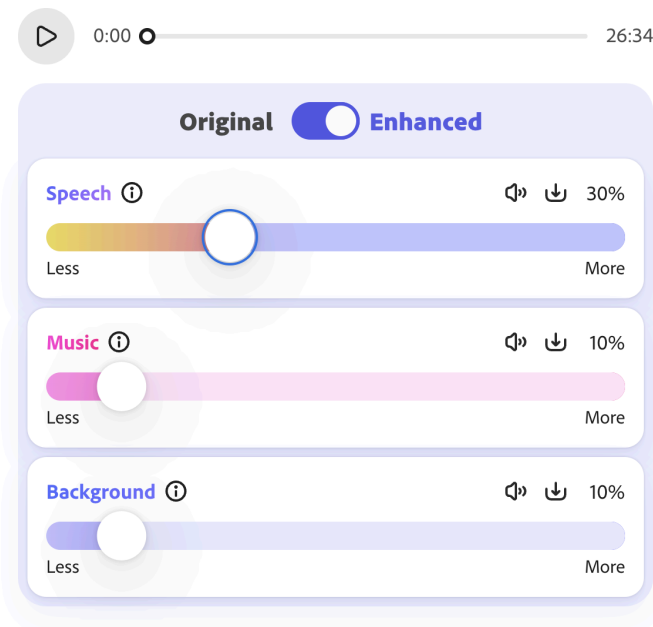

A screenshot of the 'Settings' panel for the Adobe Podcast Speech Enhancement tool. The panel has a dark background. At the top, it says 'Settings:' followed by a download icon and the text 'Media File'. Below this are four settings: 'File Name' with a text input field containing 'Raw Audio.mp3'; 'Location' with a blue-tinted image placeholder; 'Preset' with a dropdown menu showing 'Custom' and a three-dot menu icon to its right; and 'Format' with a dropdown menu showing 'MP3'.

Next, head over to [Adobe Podcast Speech Enhancement](#) and upload the audio file. You will have FREE Access to this tool with your existing Adobe subscription.

Once you've uploaded the audio file, adjust the settings until the audio quality is improved.

These are the **typical settings** we recommend for the best results:

- Speech: 30%
- Music: 10%
- Background: 10%

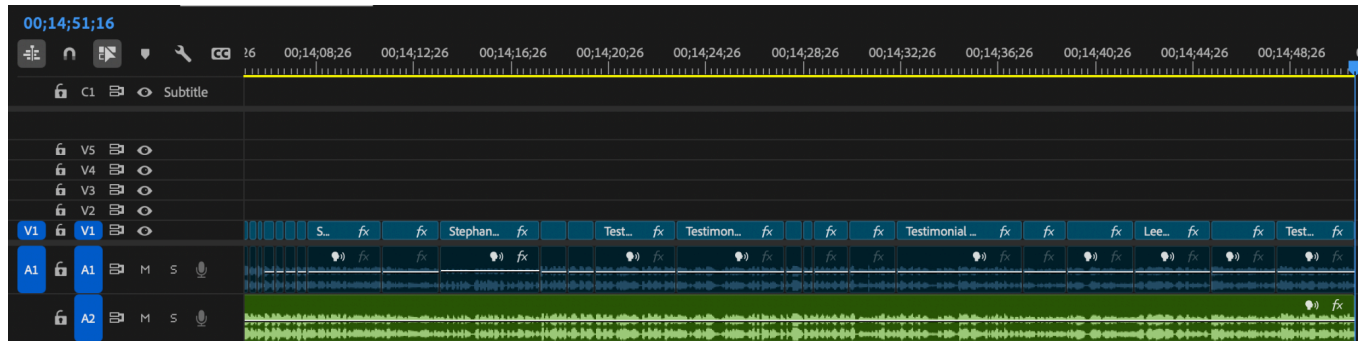

Adjust them according to the audio in your video. For example, if there is too much background noise, lower the background to 10-20%. Alternatively, if there is background music, lower the music to 10-20%.

Note: Avoid having any of the settings as 0% because this will lead to the audio sounding unnatural

Once you're satisfied with the changes, download the enhanced audio and import it into your Premier Pro Project.

Match it with the original audio and then disable the original audio so you can only hear the enhanced version. Your timeline should look something like this:

DO NOT DELETE the original audio as you may need it later on in the editing process. Deleting it could cost you hours of resyncing.

Video Tutorial -

Step 4 - Captions

Once you've completed the first three steps, it's now time to add Captions to the video. We use Premier Pro's Auto Captions feature to generate them as fast and accurately as possible.

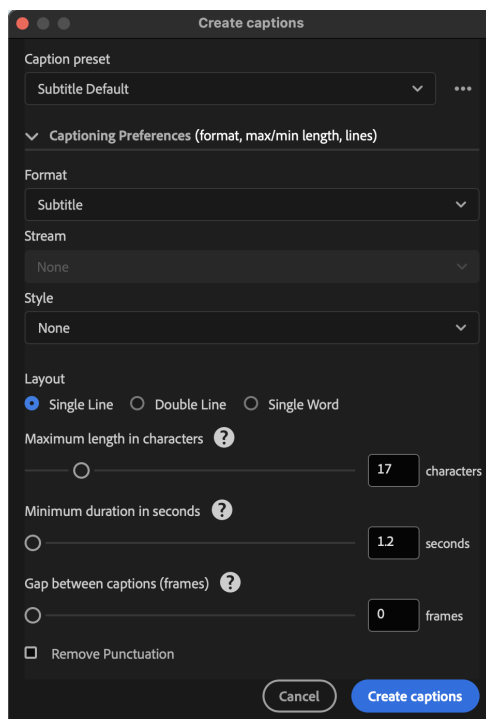

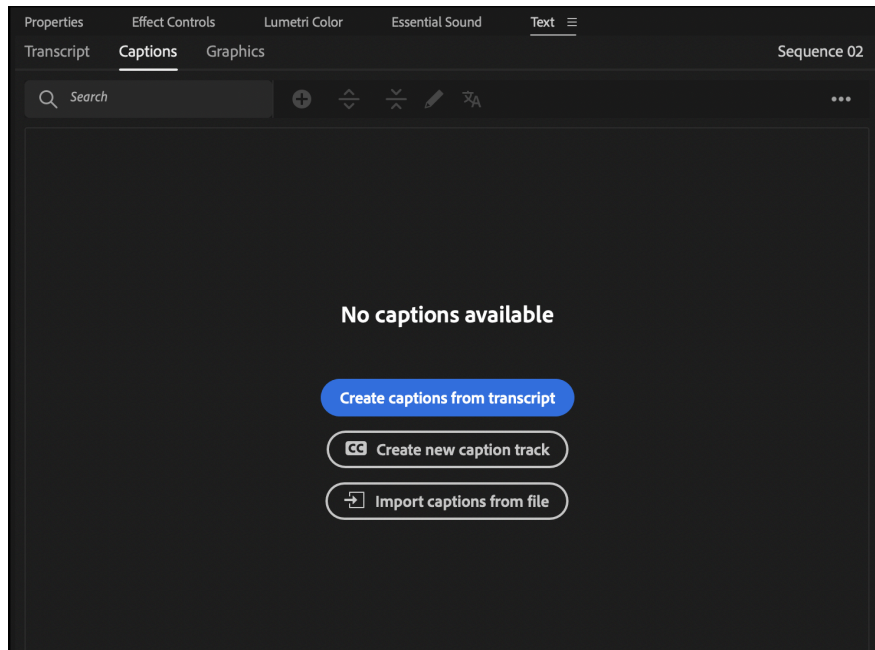

Here's how it works:

Step 1 - Head over to the Text Window and click "Create Captions From Transcript"

Step 2 - Adjust the Caption Settings to suit your preferences

We recommend:

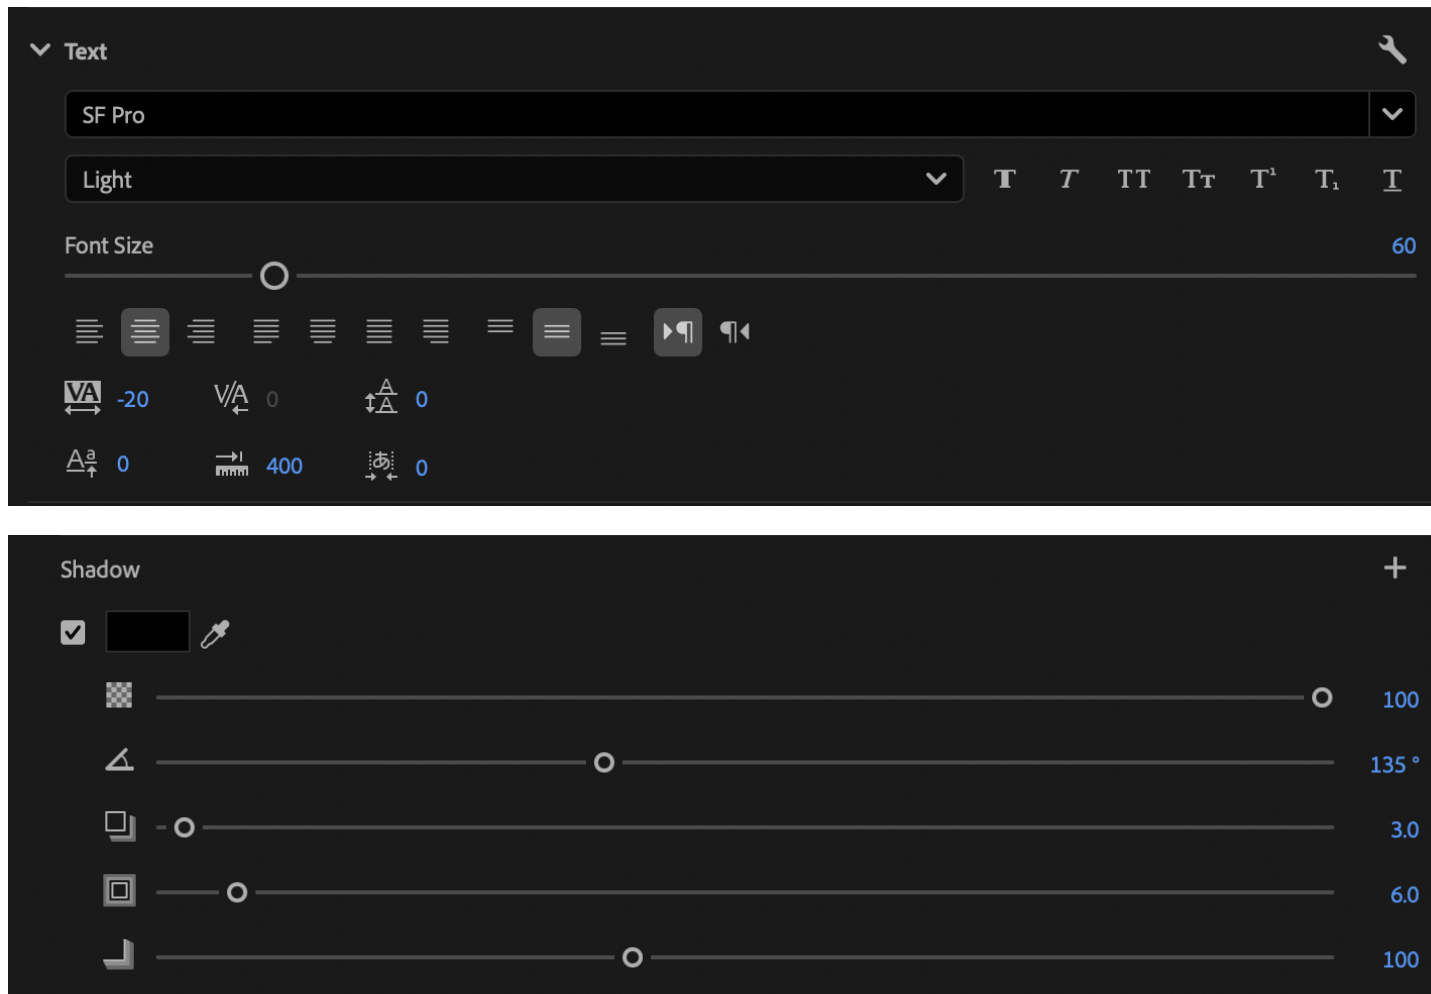

- **Layout:** Single Line
- **Minimum Length in Characters:** 17 Characters
- **Minimum Duration in Seconds:** 1.2 Characters
- **Gap Between Captions:** 0 Frames

Once you've done this, Premier Pro will auto generate Captions based on the video audio in your timeline.

The next step is to adjust the font and text settings to make it look more aesthetically pleasing. Here's the exact settings we follow on every video:

You can download the font here: [SF Pro Font Family](#)

The final step when creating the captions is now improving the accuracy. There is a **3 step process** we follow for this:

1. Review Spelling - rewatch the video and adjust all captions to ensure to spelling and wording is accurate to match what the speaker is actually saying
2. Remove punctuation - we remove all punctuation from our captions to make them look cleaner. This includes: (.,?!")
3. Make everything lowercase - we then remove all capital letters and ensure everything is lowercase. The only exception to this rule is the word "I"

Export checklist

Run this before you export a video. Every answer should be yes.

- All filler words and fluff is cut and removed from the video
- Camera is on whoever's speaking, the angle is cut on natural beats and the subject is framed correctly using rule of thirds
- Captions have zero typos, in sync with the speaker and a consistent style
- Audio levels are consistent across speakers and angles, music is not louder than speech and background noise is minimised or removed
- B-roll matches what's being said and matches the beat with consistent colour grading

- No confidential info on screen and anything the client asked to cut is gone
- Exported with the right aspect ratio, resolution, and file name
